
A
Two benchmark branches
Shared evidence input
interaction cases + target evidence
same input in both conditions
Guidance on vs off
same task and same output checks
only the guidance changes
1. Biological interpretation
Input: interaction cases
Output: interpretation
Measured: unsupported claims
Result: fewer unsupported claims
Fig. 3B
2. Follow-up recommendations
Input: target evidence package
Output: recommendations
Measured: evidence use
Result: better claim restraint
Fig. 3C
Shared evidence check
observed evidence, mechanisms, and clinical claims stay separate
